--	--

Discover / SIAv2 Input

Use Cases for Single-object /Single-emission-line datacubes

- Discover datasets observed with a specific **emission-line** given
- Discover datasets within a specified **range of velocity** for a specific spectral line

Search criteria

Spatial Axis
Coordinates ("ra,dec" in degrees):

Energy Axis

Frequency

Central value (Hz): Width (Hz):

Frequency search criteria prevail over Velocity.

Velocity

Line:

Central value (km/s): Width (km/s):

Collection
Data collection:

Observed red-shifted frequency as in instrumental set-up

LINE param linked to VELOCITY param

Discover / SIv2 Input

Use Cases for RadioInterferometry Observations

2.1.5 FOV

2.1.6 SPATRES

MRS

Maximum Recoverable Scale

Instrumental Parameter

Provides the maximum angular scale structure that may be recoverable with a given instrumental set-up.

Larger structures in the sky are "resolved out" and cannot be detected.

Discover observations performed with values greater than a "**Maximum Recoverable Scale**" param, so we are sure we do not miss any small structures in the sky.

2.1.16 SPECRP

In spectral velocity radio datacubes, resolving power (more used in optical wavelength observations) may have its analogue in the concept of "**channel width**" usually measured in units of velocity.

Discover / SIAv2 Input

Other Input Params

2.1.7 EXPTIME

User translates into “Searching data with **flux/brightness** constrained in a specified range”
In **broadcasted discovery queries** different instrumental set-up/sensitivity makes it **useless**

2.1.9 COLLECTION

2.1.10 FACILITY

2.1.11 INSTRUMENT

2.1.14 TARGET

What to do wrt. **case-sensitivity** and **strict-equality** for these string-valued params?

These params suit well for services discovery in the **Registry**

Target could be translated to coordinates by a name/coords look-up service like Sesame.

2.1.4 POL

2.1.13 CALIB

Define constraints on “**atomic values**”

Range syntax could be replaced by multi-valued OR queries

  </GROUP>
</RESOURCE>

```

What is this DataLink service proposing as additional related links?

- The service must be invoked to answer this question
- It could be useful to add a mechanism (e.g. <GROUP name="outputParams">)
- Provide a **description** of the DataLink service as number and nature of the links given
- This may be done only if the **pack of links** is the same for all the IDs in the archive
- The same mechanism could be applied for the **description of ad-hoc services**
- DALI already offers the MAXREC=0 mechanism to provide empty VOTables responses

Propose /DataLink

Integration of flux along rings on Moment Zero image

AccessData Draft

- Well suited for operations and extraction operations on **Images**
- COORD and SELECT params (Theoretical Simulations Data) slightly out of scope
- The name AccessData may be confusing -> AccessImage
- Keep it simple - **over sizing** standards may be counter-productive

- **Single param/axis and compatibility with SIA discovery params**
 - AccessImage
 - Complex Transformations on Images /Cubes
- **Atomic 3-factor semantics in input params**
 - Generic Dataset Access in Multidimensional Space
 - Filtering Operations in Pixel Space performed on single datasets

- Well suited for **broadcasted** queries producing **virtual images of the sky** on-the-fly
- Specific operations on **single datasets** may be provided as ad-hoc services

- **VO Registry**
 - Complex services like AccessImage mean complex discovery of services
 - Users would like to discover very specific services for specific purposes
